

## Suitability Checklist

Should your small business consider Utility Computing from Hoolipot? Ask yourself these questions:

Does your business need to keep information in computer systems/applications, or use those systems to process transactions?  Yes  No

Do your systems/applications require a degree of maintenance and/or support from you (including application updates, patch installations, operating system upgrades, hardware installations and the like)?  Yes  No

Is the data contained in those systems/applications essential to the operation of your business (usually containing customer information and records) and does it need to be protected and adequately backed up?  Yes  No

Is your business is looking for flexibility? Do you need to be able to increase, decrease or otherwise modify your IT requirements quickly – without capital impact?  Yes  No

Do you worry about whether you have enough memory or hard-drive space, or whether your backups can be actually used to re-start your business in an emergency?  Yes  No

Would you like to have remote access to your business applications (from home or anywhere else) so that you can operate remotely when you need to?  Yes  No

If you are said YES to three or more of the items on this list, Utility Computing could really help your business. You could save money, spend more time on your core business/expertise, gain flexibility and be assured of the security and accessibility of your business information.
